Real-Time Reyes
Programmable Pipelines and Research Challenges

Anjul Patney
University of California, Davis
This talk

• Parallel Computing for Graphics: In Action

• What does it take to write a programmable pipeline?
  – Many questions
  – Some answers

• We will focus on the Reyes pipeline
Graphics on parallel devices

• Over the years
  – Increasing performance
  – Increasing programmability

• How is that useful for real-time graphics?
  – Improve existing pipeline
  – Redesign the pipeline
Redesign the pipeline

- An Exploration
  - May not be the answer for everyone

- My Goals
  - Interactive performance
  - High visual quality

- How should I choose a pipeline?
My real-time pipeline

• An improvement in real-time rendering
  – Build around shading
  – Remove existing rendering artifacts

• Desired features
  – High-quality anti-aliasing
  – Realistic motion-blur, depth-of-field, volume effects
  – Global Illumination
  – Order-independent transparency
Reyes

• Introduced 1987

• Photorealistic rendering
  – Smooth surfaces
  – Complex shading, lighting
  – Depth of field, motion blur
  – Order-independent blending

• Designed for offline use
  – But favors SIMD
Real-Time Reyes

Input

Geometry

Shading

Sampling

Composition

Final pixels
Step 1: Geometry

Convert input surfaces to micropolygons

Input

Geometry

Shading

Sampling

Composition

Final pixels
Step 2: Shading

Decide colors for grid micropolygons

Input

Geometry

Shading

Sampling

Composition

Final pixels
Step 3: Sampling

Collect stochastic samples of micropolygons
Step 4: Image Composition

Blend samples to get colors
Combine colors to get pixels

Composition

Final pixels
Step 1: Geometry

Convert input surfaces to micropolygons

Input

Geometry

Shading

Sampling

Composition

Final pixels
Input

- Higher-order surfaces
  - Bézier surfaces
  - NURBS
  - Subdivision surfaces

- Displacement-mapped

- Animated

Hand image courtesy: Tamy Boubekeur, Christophe Schlick
Task – Split and Dice

• Adaptively subdivide the input surface

• Tessellate when small enough

• Rinse and repeat
Challenges

• Recursive, irregular computation
  – Bad for parallelism, SIMD

• Too many micropolygons
  – Limited memory
Ideas

- Breadth-first Traversal
- Bucket Rendering
Works in real-time!

- Killeroo: 11532 Patches
- Split and dice in 9.8 ms
- 29.69 fps at 512 x 512
- Parametric surfaces only
- Subdivision cracks

Patney and Owens, 2008

Killeroo Model Courtesy Headus Inc.
Geometry Output – Unshaded Grids

1 Grid

Micropolygons
Step 2: Shading

Decide colors for grid micropolygons

Input

Geometry

Shading

Sampling

Composition

Final pixels
Task

- Run shader(s) for each grid
  - Displacement
  - Surface
  - Light
  - Volume
  - Imager

- Good behavior
  - Highly parallel, SIMD friendly
  - Good locality behavior

Image courtesy: Saty Raghavachary
Challenges

• Massively parallel is great
  – But is it good enough?

• Shaders can be complex
  – Too many instructions, conditionals
  – Global illumination
  – File I/O
  – Arbitrary texture fetches
Ideas

• Cache redundant computation
  – Across a grid
  – Across frames

• Architectural support
  – Virtual memory
Interactive Relighting

- **Lpics** [Pellacini 2005]
  - Cache image-space samples
  - Interactive feedback
  - Manual pre-processing

- **Lightspeed** [Ragan-Kelley 2007]
  - Shader caching
  - Interactive preview
  - Slow pre-processing

Images belong to respective paper authors
Output – Shaded Grids
Bust: Many micropolygons
Step 3: Sampling

Collect stochastic samples of micropolygons
Task
Samples

Challenges

• Generate samples
  – Jittered grid
  – Parallel Poisson sampling [Wei 2008]

• For each sample, find all intersecting micropolygons
  – Raycast or Rasterize?

• Output: A (depth-sorted?) list of samples
Step 4: Image Composition

- Blend samples to get colors
- Combine colors to get pixels

Input → Geometry → Shading → Sampling → Composition → Final pixels
Task 1: Blend
Task 2: Filter to get pixel colors
Challenges

• Represent the irregular work-list
  – Traditionally: linked-list per sample (arbitrary size)

• Sort and Reduce
  – Unequal work-items

• Generate and apply filter kernels
  – Box
  – Gaussian
Stencil-Routed A-buffer

Myers and Bavoil, NVIDIA, 2007
Summary: What is easy?

- Can be parallelized well
- Highly Parallel, SIMD friendly
- Good locality behavior
- Parallel Poisson Sampling

Input

Geometry

Shading

Sampling

Composition

Final pixels
Summary: What is hard?

- Subdivision Surfaces, cracks
- Long shaders
- File I/O, arbitrary textures
- Raycast or Rasterize?
- Sort and reduce irregular worklists

Input

Geometry

Shading

Sampling

Composition

Final pixels
Conclusion

• Reyes is promising for real-time
  – Enables natural high-quality rendering
  – Portions map well to current hardware

• But there are challenges
  – Everything isn’t easy to implement
  – Architecture limitations

• Lots of interesting questions

Realistic Effects using Reyes

- **Motion-blur**
  - A stochastic time for each sample
  - Move micropolygons accordingly

- **Depth-of-field**
  - A stochastic lens position for each sample
  - Render micropolygons accordingly

- Take many samples to ensure quality
- Adjust screen bound during subdivision
Global Illumination with Reyes

• Traditional: shadow maps, environment maps

• Raytracing [Christensen et al. 2006]
  – Multi-level geometry cache
  – Ray-differentials to select appropriate resolution

• Effects taken care of
  – Shadows and reflections
  – Ambient Occlusion
My version of the world - today

- Many SIMD Cores (16-32)
- Precious memory bandwidth
- Data-parallel (SPMD)
My version of the world - tomorrow

- More cores, still SIMD (8-16)
- Memory bandwidth still precious
  - But flexible access behavior
- Data-Parallel and Task-Parallel
